

VIPlanning where innovative ideas lead to sustainable, cost-effective solutions

Visual Imagry has been pioneering emergency preparedness and information management tools since 1998. Our VIPlanning® Software provides innovative solutions for organizing facility data into emergency plans, safety audits, hazards assessments and operations manuals. VIPlanning® Online Services also provides affordable online solutions for tracking drills, exercises and incidents; centralizing communications and collaboration efforts; and for tracking trainings and certifications.

Visual Imagry is ready to partner with you to make your emergency plans and preplans the useful, versatile, rich and sustainable sources of information they can be. Call today to schedule an online DEMO of VIPlanning® Software and Online Services.

*“Visual Imagry is on the cutting edge of HTML preplan and project management software.”
Sabrina Bustamante, Kings County, CA. Public Health Department*

*“Without doubt, this new technology could end up saving lives and protecting property.”
Police Chief Mike Mieras, Washoe County School District, Reno, NV.*

HTML Solutions for Emergency Plans and Safety Audits

Is it time to bring your emergency plans and preplans out of the dark ages of three ring binders and into the virtual world of emergency management? Whether you are a public agency, school district or private company, VIPlanning® Software assures that building, maintaining and using your HTML plans is quick, easy, and sustainable.

From those tasked with inputting data, to those accessing it in a crisis, users are finding VIPlanning® Software remarkably easy to use, yet incredibly rich in data potential.

Creating, Inputting and Updating Plans with VIPlanning Software is:

Easy to learn

Typical training times range from 1 to 3 days for your existing personnel.

Simple and Fast

Familiar paradigms, like drag and drop, along with common visual presentations, such as outlines and thumbnails, combine to make a simple yet powerful user interface. When further enhanced with customizable templates, our powerful toolset reduces the staff time needed to build and maintain plans.

Versatile and Efficient

Many types of plans can be created from the same data, making it practical to tailor plans to users without entering and maintaining redundant information.

Easy to Update

VIPlanning® Software is designed to be so user friendly that periodic updates can be made and propagated in minutes not days. The rapid update process encourages plan use and overall sustainability.

Easy to Share and Store

Content linking allows designated information in one plan to be shared with other plans in a matter of seconds. Changes to linked content are automatically propagated to all shared plans; updates can be compiled, stored and shared easily on discs, hard-drives or secure internet sites; and cost of reproduction is a fraction of paper-based plans.

Under Your Control

You own and directly control the data and plans created. You decide who updates the plans, when they are updated and where they are distributed. Since each plan can be customized, you can enhance security by selectively distributing task specific information and plans to different agencies and personnel.

Low Maintenance

Software installation and updates are simple, typically requiring less than an hour each. Ongoing maintenance (backup) can be easily automated and integrated into your existing procedures. In most cases, you can use your existing networks, servers, workstations, or laptops.

Plan Output Created with VIPlanning Software is:

Easy to Use

Standardized layout and navigation techniques make plans both familiar and easy to use, even for novice users. Indexing, hot linking and searching combine to permit rapid and easy access to relevant data.

Rich in Content

Using HTML plans allows you to optimally combine visual, text and data- based information for a concise, rich, easy to use presentation. Annotated pictorials including aerials and floor plans, digital photos and 360 movies can offer virtual tours of entire facilities or pinpoint a single trouble spot. The visual data can be linked to PDFs, Excel Spreadsheets, Word documents, Power Point presentations and more.

Flexible

It is easy to create plans tailored to specific user groups like fire, police, medical, public health, public works or facility operations. These targeted plans can be used for training, exercise design, in the field, or even providing detailed facility-based information at emergency operations centers.

Accurate and Timely

Because plans are easy to use and update, data remains available and reliable, encouraging increased utilization, participation and feedback from users.

Available

Your HTML plans can be accessible when and where designated users need them, via your intranet or secure internet site or distributed inexpensively via a CD, DVD or flash drive. For viewing plan output, users only need Internet Explorer or Firefox.

The VIPlanning® Software Toolbox includes everything you need for building useful, accessible and robust plans. The tools are integrated to make plan building easy and to avoid the need to purchase, learn and integrate additional software. Tool flexibility allows you to build many types of plans (emergency plans, preplans, safety audits, operational plans, etc) tailored for a variety of users and purposes.

In the VIPlanning® Software Toolbox you will find:

Navigation Tools

VIPlanning uses a building block approach to organize information. Self-contained blocks are organized in a hierarchical outline. Drag and drop capability makes moving a block or group of blocks within the outline simple.

Indexing Tool

Keywords are the basis for each plan's index. Indexing automatically creates lists of pictures, 360 panoramas, areas, details, floor and site plans, and page titles. You can augment standard indexing by providing keywords for many block types.

Importing Tools

All items needed to produce plans are maintained in a repository. Files of all types (Word, Excel, PowerPoint, bitmap [jpg, gif, and png], 360° pictures, etc) can be easily imported into that repository individually or in groups. Bitmap images are automatically scaled to a size convenient for presentation. Thumbnails are created and later used to locate and place files in blocks.

Annotation Tools

With this fully integrated tool box, you can annotate and hyperlink any bitmap image (digital photo, aerial or floor plan) with text or graphic symbols like boxes, lines and arrows. The annotations are maintained separately from the bitmap image making subsequent updates simple.

Text Management Tools

The incorporated mini word processor allows you to enter and format text. Tables and lists are available and styles can be defined and applied. Text from external documents can also be included using copy and paste.

Content Linking Tools

With linking, you enter and maintain information in one place while making it visible in other places either within a single plan or across multiple plans. Any amount of information can be linked, from a single block to an entire plan.

Data Tools

With the data feature you can define a data store, enter data into that store and then include that data in your plan in a tabular format. Data can be filtered, organized and sorted for presentation.

Output Tool

Our output tool allows you to quickly define and produce plan output without opening other programs. Finished plans, with data relevant to various first responders and staff, can be posted on secure intranet or internet sites or distributed on CD-ROMs, DVDs or Flash Drives where each designated user will have access to a vast array of tightly organized, critical data when and where they need it.
